2. The Euler formula for this problem is

$$y_{n+1} = y_n + h(5t_n - 3\sqrt{y_n}),$$

in which $t_n = t_0 + nh$. Since $t_0 = 0$, we can also write

$$y_{n+1} = y_n + 5nh^2 - 3h\sqrt{y_n},$$

with $y_0 = 2$.

(a). Euler method with $h = 0.05$:

	$n = 2$	$n = 4$	$n = 6$	$n = 8$
t_n	0.1	0.2	0.3	0.4
y_n	1.59980	1.29288	1.07242	0.930175

(b). Euler method with $h = 0.025$:

	$n = 4$	$n = 8$	$n = 12$	$n = 16$
t_n	0.1	0.2	0.3	0.4
y_n	1.61124	1.31361	1.10012	0.962552

The *backward* Euler formula is

$$y_{n+1} = y_n + h(5t_{n+1} - 3\sqrt{y_{n+1}}),$$

in which $t_n = t_0 + nh$. Since $t_0 = 0$, we can also write

$$y_{n+1} = y_n + 5(n+1)h^2 - 3h\sqrt{y_{n+1}},$$

with $y_0 = 2$. Solving for y_{n+1} , and choosing the *positive* root, we find that

$$y_{n+1} = \left[-\frac{3}{2}h + \frac{1}{2}\sqrt{(20n+29)h^2 + 4y_n} \right]^2.$$

(c). Backward Euler method with $h = 0.05$:

3. The Euler formula for this problem is

$$y_{n+1} = y_n + h(2y_n - 3t_n),$$

in which $t_n = t_0 + nh$. Since $t_0 = 0$,

$$y_{n+1} = y_n + 2hy_n - 3nh^2,$$

with $y_0 = 1$.

(a). Euler method with $h = 0.05$:

	$n = 2$	$n = 4$	$n = 6$	$n = 8$
t_n	0.1	0.2	0.3	0.4
y_n	1.2025	1.41603	1.64289	1.88590

(b). Euler method with $h = 0.025$:

	$n = 4$	$n = 8$	$n = 12$	$n = 16$
t_n	0.1	0.2	0.3	0.4
y_n	1.20388	1.41936	1.64896	1.89572

The *backward* Euler formula is

$$y_{n+1} = y_n + h(2y_{n+1} - 3t_{n+1}),$$

in which $t_n = t_0 + nh$. Since $t_0 = 0$, we can also write

$$y_{n+1} = y_n + 2hy_{n+1} - 3(n+1)h^2,$$

with $y_0 = 1$. Solving for y_{n+1} , we find that

$$y_{n+1} = \frac{y_n - 3(n+1)h^2}{1 - 2h}.$$

(c). Backward Euler method with $h = 0.05$:

	$n = 2$	$n = 4$	$n = 6$	$n = 8$
t_n	0.1	0.2	0.3	0.4
y_n	1.20864	1.43104	1.67042	1.93076

4. The Euler formula is

$$y_{n+1} = y_n + h[2t_n + \exp(-t_n y_n)].$$

Since $t_n = t_0 + nh$ and $t_0 = 0$, we can also write

$$y_{n+1} = y_n + 2nh^2 + h \exp(-nh y_n),$$

with $y_0 = 1$.

(a). Euler method with $h = 0.05$:

	$n = 2$	$n = 4$	$n = 6$	$n = 8$

t_n	0.1	0.2	0.3	0.4
y_n	1.10365	1.21656	1.33817	1.46832

The *backward* Euler formula is

$$y_{n+1} = y_n + h[2t_{n+1} + \exp(-t_{n+1} y_{n+1})].$$

Since $t_0 = 0$ and $t_{n+1} = (n+1)h$, we can also write

$$y_{n+1} = y_n + 2h^2(n+1) + h \exp[-(n+1)h y_{n+1}],$$

with $y_0 = 1$. This equation cannot be solved *explicitly* for y_{n+1} . At each step, given the current value of y_n , the equation must be solved *numerically* for y_{n+1} .

y_n	1.10720	1.22333	1.34797	1.48110

(d). Backward Euler method with $h = 0.025$:

	$n = 4$	$n = 8$	$n = 12$	$n = 16$

y_n	1.10603	1.22110	1.34473	1.47688

6. The Euler formula for this problem is

$$y_{n+1} = y_n + h(t_n^2 - y_n^2) \sin y_n.$$

Here $t_0 = 0$ and $t_n = nh$. So that

$$y_{n+1} = y_n + h(n^2 h^2 - y_n^2) \sin y_n,$$

with $y_0 = -1$.

(b). Euler method with $h = 0.025$:

	$n = 4$	$n = 8$	$n = 12$	$n = 16$

y_n	- 0.922575	- 0.860923	- 0.82300	- 0.774965

The *backward* Euler formula is

$$y_{n+1} = y_n + h(t_{n+1}^2 - y_{n+1}^2) \sin y_{n+1}.$$

Since $t_0 = 0$ and $t_{n+1} = (n + 1)h$, we can also write

$$y_{n+1} = y_n + h[(n + 1)^2 h^2 - y_{n+1}^2] \sin y_{n+1},$$

with $y_0 = -1$. Note that this equation cannot be solved *explicitly* for y_{n+1} . Given y_n , the transcendental equation

$$y_{n+1} + h y_{n+1}^2 \sin y_{n+1} = y_n + h(n + 1)^2 h^2$$

must be solved *numerically* for y_{n+1} .

in which $t_n = t_0 + nh$. Since $t_0 = 0$, we can also write

$$y_{n+1} = y_n + 5nh^2 - 3h\sqrt{y_n},$$

with $y_0 = 2$.

y_n	0.891830	1.25225	2.37818	4.07257

(b). Euler method with $h = 0.0125$:

	$n = 40$	$n = 80$	$n = 120$	$n = 160$
t_n	0.5	1.0	1.5	2.0
y_n	0.908902	1.26872	2.39336	4.08799

The *backward* Euler formula is

$$y_{n+1} = y_n + h(5t_{n+1} - 3\sqrt{y_{n+1}}),$$

in which $t_n = t_0 + nh$. Since $t_0 = 0$, we can also write

$$y_{n+1} = y_n + 5(n+1)h^2 - 3h\sqrt{y_{n+1}},$$

with $y_0 = 2$. Solving for y_{n+1} , and choosing the *positive* root, we find that

9. The Euler formula for this problem is

$$y_{n+1} = y_n + h\sqrt{t_n + y_n}.$$

Here $t_0 = 0$ and $t_n = nh$. So that

$$y_{n+1} = y_n + h\sqrt{nh + y_n},$$

with $y_0 = 3$.

10. The Euler formula is

$$y_{n+1} = y_n + h[2t_n + \exp(-t_n y_n)].$$

Since $t_n = t_0 + nh$ and $t_0 = 0$, we can also write

$$y_{n+1} = y_n + 2nh^2 + h \exp(-nh y_n),$$

with $y_0 = 1$.

(a). Euler method with $h = 0.025$:

	$n = 20$	$n = 40$	$n = 60$	$n = 80$
t_n	0.5	1.0	1.5	2.0
y_n	1.60729	2.46830	3.72167	5.45963

(b). Euler method with $h = 0.0125$:

t_n	0.5	1.0	1.5	2.0
y_n	1.60996	2.47460	3.73356	5.47774

The *backward* Euler formula is

$$y_{n+1} = y_n + h[2t_{n+1} + \exp(-t_{n+1} y_{n+1})].$$

Since $t_0 = 0$ and $t_{n+1} = (n+1)h$, we can also write

$$y_{n+1} = y_n + 2h^2(n+1) + h \exp[-(n+1)h y_{n+1}],$$

with $y_0 = 1$. This equation cannot be solved *explicitly* for y_{n+1} . At each step, given the current value of y_n , the equation must be solved *numerically* for y_{n+1} .

t_n	0.5	1.0	1.5	2.0
y_n	1.61528	2.48723	3.75742	5.51404

11. The Euler formula is

$$y_{n+1} = y_n + h(4 - t_n y_n)/(1 + y_n^2).$$

Since $t_n = t_0 + nh$ and $t_0 = 0$, we can also write

$$y_{n+1} = y_n + (4h - nh^2 y_n)/(1 + y_n^2),$$

with $y_0 = -2$.

(a). Euler method with $h = 0.025$:

	$n = 20$	$n = 40$	$n = 60$	$n = 80$
t_n	0.5	1.0	1.5	2.0
y_n	-1.45865	-0.217545	1.05715	1.41487

(b). Euler method with $h = 0.0125$:

t_n	0.5	1.0	1.5	2.0
y_n	-1.45322	-0.180813	1.05903	1.41244

The *backward* Euler formula is

$$y_{n+1} = y_n + h(4 - t_{n+1} y_{n+1})/(1 + y_{n+1}^2).$$

Since $t_0 = 0$ and $t_{n+1} = (n + 1)h$, we can also write

$$y_{n+1}(1 + y_{n+1}^2) = y_n(1 + y_{n+1}^2) + [4h - (n + 1)h^2 y_{n+1}],$$

with $y_0 = -2$. This equation cannot be solved *explicitly* for y_{n+1} . At each step, given the current value of y_n , the equation must be solved *numerically* for y_{n+1} .

t_n	0.5	1.0	1.5	2.0
y_n	-1.44190	-0.105737	1.06290	1.40789

12. The Euler formula is

$$y_{n+1} = y_n + h(y_n^2 + 2t_n y_n)/(3 + t_n^2).$$

Since $t_n = t_0 + nh$ and $t_0 = 0$, we can also write

$$y_{n+1} = y_n + (h y_n^2 + 2nh^2 y_n)/(3 + n^2 h^2),$$

with $y_0 = 0.5$.

(a). Euler method with $h = 0.025$:

	$n = 20$	$n = 40$	$n = 60$	$n = 80$
t_n	0.5	1.0	1.5	2.0
y_n	0.587987	0.791589	1.14743	1.70973

(b). Euler method with $h = 0.0125$:

	$n = 40$	$n = 80$	$n = 120$	$n = 160$
t_n	0.5	1.0	1.5	2.0
y_n	0.589440	0.795758	1.15693	1.72955

The *backward* Euler formula is

$$y_{n+1} = y_n + h(y_{n+1}^2 + 2t_{n+1} y_{n+1})/(3 + t_{n+1}^2).$$

Since $t_0 = 0$ and $t_{n+1} = (n + 1)h$, we can also write

$$y_{n+1} [3 + (n + 1)^2 h^2] - h y_{n+1}^2 = y_n [3 + (n + 1)^2 h^2] + 2(n + 1)h^2 y_{n+1},$$

with $y_0 = 0.5$. Note that although this equation can be solved *explicitly* for y_{n+1} , it is also possible to use a numerical equation solver. At each time step, given the current

value of y_n , the equation may be solved *numerically* for y_{n+1} .

(c). Backward Euler method with $h = 0.025$:

	$n = 20$	$n = 40$	$n = 60$	$n = 80$
t_n	0.5	1.0	1.5	2.0
y_n	0.593901	0.808716	1.18687	1.79291

(d). Backward Euler method with $h = 0.0125$:

	$n = 40$	$n = 80$	$n = 120$	$n = 160$
t_n	0.5	1.0	1.5	2.0
y_n	0.592396	0.804319	1.17664	1.77111

13. The Euler formula for this problem is

$$y_{n+1} = y_n + h(1 - t_n + 4y_n),$$

in which $t_n = t_0 + nh$. Since $t_0 = 0$, we can also write

$$y_{n+1} = y_n + h - nh^2 + 4hy_n,$$

with $y_0 = 1$. With $h = 0.01$, a total number of 200 iterations is needed to reach $\bar{t} = 2$. With $h = 0.001$, a total of 2000 iterations are necessary.

14. The *backward* Euler formula is

$$y_{n+1} = y_n + h(1 - t_{n+1} + 4y_{n+1}).$$

Since the equation is linear, we can solve for y_{n+1} in terms of y_n :

$$y_{n+1} = \frac{y_n + h - h t_{n+1}}{1 - 4h}.$$

Here $t_0 = 0$ and $y_0 = 1$. With $h = 0.01$, a total number of 200 iterations is needed to reach $\bar{t} = 2$. With $h = 0.001$, a total of 2000 iterations are necessary.

18. Let $\phi(t)$ be a solution of the initial value problem. The *local* truncation error for the Euler method, on the interval $t_n \leq t \leq t_{n+1}$, is given by

$$e_{n+1} = \frac{1}{2} \phi''(\bar{t}_n) h^2,$$

where $t_n < \bar{t}_n < t_{n+1}$. Since $\phi'(t) = t^2 + [\phi(t)]^2$, it follows that

$$\begin{aligned} \phi''(t) &= 2t + 2\phi(t)\phi'(t) \\ &= 2t + 2t^2\phi(t) + 2[\phi(t)]^3. \end{aligned}$$

Hence

$$|e_{n+1}| \leq [t_{n+1} + t_{n+1}^2 M_{n+1} + M_{n+1}^3] h^2,$$

in which $M_{n+1} = \max\{\phi(t) \mid t_n \leq t \leq t_{n+1}\}$.

20. Given that $\phi(t)$ is a solution of the initial value problem, the *local* truncation error for the Euler method, on the interval $t_n \leq t \leq t_{n+1}$, is

$$e_{n+1} = \frac{1}{2} \phi''(\bar{t}_n) h^2,$$

where $t_n < \bar{t}_n < t_{n+1}$. Based on the ODE, $\phi'(t) = \sqrt{t + \phi(t)}$, and hence

$$\begin{aligned} \phi''(t) &= \frac{1 + \phi'(t)}{2\sqrt{t + \phi(t)}} \\ &= \frac{1}{2\sqrt{t + \phi(t)}} + \frac{1}{2}. \end{aligned}$$

Therefore

$$|e_{n+1}| \leq \frac{1}{4} \left[1 + \frac{1}{\sqrt{\bar{t}_n + \phi(\bar{t}_n)}} \right] h^2.$$

21. Let $\phi(t)$ be a solution of the initial value problem. The *local* truncation error for the Euler method, on the interval $t_n \leq t \leq t_{n+1}$, is given by

$$e_{n+1} = \frac{1}{2} \phi''(\bar{t}_n) h^2,$$

where $t_n < \bar{t}_n < t_{n+1}$. Since $\phi'(t) = 2t + \exp[-t\phi(t)]$, it follows that

$$\begin{aligned} \phi''(t) &= 2 - 2[\phi(t) + t\phi'(t)] \cdot \exp[-t\phi(t)] \\ &= 2 - \{\phi(t) + 2t^2 + t\exp[-t\phi(t)]\} \cdot \exp[-t\phi(t)]. \end{aligned}$$

Hence

$$e_{n+1} = h^2 - \frac{h^2}{2} \left\{ \phi(\bar{t}_n) + 2\bar{t}_n^2 + \bar{t}_n \exp[-\bar{t}_n \phi(\bar{t}_n)] \right\} \cdot \exp[-\bar{t}_n \phi(\bar{t}_n)].$$

22(a). Direct integration yields $\phi(t) = \frac{1}{5\pi} \sin 5\pi t + 1$.

(d). Since $\phi''(t) = -5\pi \sin 5\pi t$, the local truncation error for the Euler method, on the interval $t_n \leq t \leq t_{n+1}$, is given by

$$e_{n+1} = -\frac{5\pi h^2}{2} \sin 5\pi \bar{t}_n.$$

In order to satisfy

$$|e_{n+1}| \leq \frac{5\pi h^2}{2} < 0.05,$$

it is necessary that

$$h < \frac{1}{\sqrt{50\pi}} \approx 0.08.$$

$$1000 \cdot \begin{vmatrix} 6.0 & 18 \\ 2.0 & 6.0 \end{vmatrix} = 1000 \cdot (0) = 0.$$

(b).

$$1000 \cdot \begin{vmatrix} 6.01 & 18.0 \\ 2.00 & 6.00 \end{vmatrix} = 1000(0.06) = 60.$$

(c).

$$1000 \cdot \begin{vmatrix} 6.010 & 18.04 \\ 2.004 & 6.000 \end{vmatrix} = 1000(-0.09216) = -92.16.$$

27. Rounding to *three* digits, $a(b - c) \approx 0.224$. Likewise, to *three* digits, $ab \approx 0.702$ and $ac \approx 0.477$. It follows that $ab - ac \approx 0.225$.

Since $t_n = t_0 + nh$ and $t_0 = 0$, we can also write

16. The exact solution of the initial value problem is $\phi(t) = \frac{1}{2} + \frac{1}{2}e^{2t}$. Based on the result in Prob. 14(c), the local truncation error for a *linear* differential equation is

$$e_{n+1} = \frac{1}{6} \phi'''(\bar{t}_n) h^3,$$

where $t_n < \bar{t}_n < t_{n+1}$. Since $\phi'''(t) = 4e^{2t}$, the local truncation error is

$$e_{n+1} = \frac{2}{3} \exp(2\bar{t}_n) h^3.$$

Furthermore, with $0 \leq \bar{t}_n \leq 1$,

$$|e_{n+1}| \leq \frac{2}{3} e^2 h^3.$$

It also follows that for $h = 0.1$,

$$|e_1| \leq \frac{2}{3} e^{0.2} (0.1)^3 = \frac{1}{1500} e^{0.2}.$$

Using the improved Euler method, with $h = 0.1$, we have $y_1 \approx 1.11000$. The exact value is given by $\phi(0.1) = 1.1107014$.

17. The exact solution of the initial value problem is given by $\phi(t) = \frac{1}{2}t + e^{2t}$. Using the modified Euler method, the local truncation error for a *linear* differential equation is

$$e_{n+1} = \frac{1}{6} \phi'''(\bar{t}_n) h^3,$$

where $t_n < \bar{t}_n < t_{n+1}$. Since $\phi'''(t) = 8e^{2t}$, the local truncation error is

$$e_{n+1} = \frac{4}{3} \exp(2\bar{t}_n) h^3.$$

Furthermore, with $0 \leq \bar{t}_n \leq 1$, the *local* error is bounded by

$$|e_{n+1}| \leq \frac{4}{3} e^2 h^3.$$

It also follows that for $h = 0.1$,

$$|e_1| \leq \frac{4}{3} e^{0.2} (0.1)^3 = \frac{1}{750} e^{0.2}.$$

Using the improved Euler method, with $h = 0.1$, we have $y_1 \approx 1.27000$. The exact value is given by $\phi(0.1) = 1.271403$.

18. Using the *Euler method*,

$$\begin{aligned} y_1 &= 1 + 0.1(0.5 - 0 + 2 \cdot 1) \\ &= 1.25. \end{aligned}$$

Using the *improved Euler method*,

$$\begin{aligned} y_1 &= 1 + 0.05(0.5 - 0 + 2 \cdot 1) + 0.05(0.5 - 0.1 + 2 \cdot 1.25) \\ &= 1.27. \end{aligned}$$

The estimated error is $e_1 \approx 1.27 - 1.25 = 0.02$. The step size should be adjusted by a factor of $\sqrt{0.0025/0.02} \approx 0.354$. Hence the required step size is estimated as

$$h \approx (0.1)(0.36) = 0.036.$$

20. Using the *Euler method*,

$$\begin{aligned} y_1 &= 3 + 0.1\sqrt{0+3} \\ &= 3.173205. \end{aligned}$$

Using the *improved Euler method*,

$$\begin{aligned} y_1 &= 3 + 0.05\sqrt{0+3} + 0.05\sqrt{0.1+3.173205} \\ &= 3.177063. \end{aligned}$$

The estimated error is $e_1 \approx 3.177063 - 3.173205 = 0.003858$. The step size should be adjusted by a factor of $\sqrt{0.0025/0.003858} \approx 0.805$. Hence the required step size is estimated as

$$h \approx (0.1)(0.805) = 0.0805.$$

21. Using the *Euler method*,

$$\begin{aligned} y_1 &= 0.5 + 0.1 \frac{(0.5)^2 + 0}{3 + 0} \\ &= 0.508334 \end{aligned}$$

Using the *improved Euler method*,

$$\begin{aligned} y_1 &= 0.5 + 0.05 \frac{(0.5)^2 + 0}{3 + 0} + 0.05 \frac{(0.508334)^2 + 2(0.1)(0.508334)}{3 + (0.1)^2} \\ &= 0.510148. \end{aligned}$$

The estimated error is $e_1 \approx 0.510148 - 0.508334 = 0.0018$. The local truncation error is *less than the given tolerance*. The step size can be adjusted by a factor of $\sqrt{0.0025/0.0018} \approx 1.1785$. Hence it is possible to use a step size of

$$h \approx (0.1)(1.1785) \approx 0.117.$$

22. Assuming that the solution has continuous derivatives at least to the third order,

$$\phi(t_{n+1}) = \phi(t_n) + \phi'(t_n)h + \frac{\phi''(t_n)}{2!}h^2 + \frac{\phi'''(\bar{t}_n)}{3!}h^3,$$

where $t_n < \bar{t}_n < t_{n+1}$. Suppose that $y_n = \phi(t_n)$.

(a). The local truncation error is given by

$$e_{n+1} = \phi(t_{n+1}) - y_{n+1}.$$

The *modified Euler formula* is defined as

$$y_{n+1} = y_n + h f \left[t_n + \frac{1}{2}h, y_n + \frac{1}{2}h f(t_n, y_n) \right].$$

Observe that $\phi'(t_n) = f(t_n, \phi(t_n)) = f(t_n, y_n)$. It follows that

$$\begin{aligned} e_{n+1} &= \phi(t_{n+1}) - y_{n+1} \\ &= h f(t_n, y_n) + \frac{\phi''(t_n)}{2!} h^2 + \frac{\phi'''(\bar{t}_n)}{3!} h^3 - \\ &\quad - h f \left[t_n + \frac{1}{2}h, y_n + \frac{1}{2}h f(t_n, y_n) \right]. \end{aligned}$$

(b). As shown in Prob. 14(b),

$$\phi''(t_n) = f_t(t_n, y_n) + f_y(t_n, y_n) f(t_n, y_n).$$

Furthermore,

$$\begin{aligned} f \left[t_n + \frac{1}{2}h, y_n + \frac{1}{2}h f(t_n, y_n) \right] &= f(t_n, y_n) + f_t(t_n, y_n) \frac{h}{2} + f_y(t_n, y_n) k + \\ &\quad + \frac{1}{2!} \left[\frac{h^2}{4} f_{tt} + h k f_{ty} + k^2 f_{yy} \right]_{t=\xi, y=\eta}, \end{aligned}$$

in which $k = \frac{1}{2}h f(t_n, y_n)$ and $t_n < \xi < t_n + h/2$, $y_n < \eta < y_n + k$. Therefore

$$e_{n+1} = \frac{\phi'''(\bar{t}_n)}{3!} h^3 - \frac{h}{2!} \left[\frac{h^2}{4} f_{tt} + h k f_{ty} + k^2 f_{yy} \right]_{t=\xi, y=\eta}.$$

Note that each term in the brackets has a factor of h^2 . Hence the local truncation error is *proportional to* h^3 .

(c). If $f(t, y)$ is linear, then $f_{tt} = f_{ty} = f_{yy} = 0$, and

$$e_{n+1} = \frac{\phi'''(\bar{t}_n)}{3!} h^3.$$

23. The *modified* Euler formula for this problem is

$$\begin{aligned} y_{n+1} &= y_n + h \left\{ 3 + t_n + \frac{1}{2}h - \left[y_n + \frac{1}{2}h(3 + t_n - y_n) \right] \right\} \\ &= y_n + h(3 + t_n - y_n) + \frac{h^2}{2}(y_n - t_n - 2). \end{aligned}$$

Since $t_n = t_0 + nh$ and $t_0 = 0$, we can also write

$$y_{n+1} = y_n + h(3 + nh - y_n) + \frac{h^2}{2}(y_n - nh - 2),$$

with $y_0 = 1$. Setting $h = 0.1$, we obtain the following values :

	$n = 1$	$n = 2$	$n = 3$	$n = 4$
t_n	0.1	0.2	0.3	0.4
y_n	1.19500	1.38098	1.55878	1.72920

25. The *modified* Euler formula is

$$\begin{aligned}
 y_{n+1} &= y_n + h \left[2y_n - 3t_n - \frac{3}{2}h + h(2y_n - 3t_n) \right] \\
 &= y_n + h(2y_n - 3t_n) + \frac{h^2}{2}(4y_n - 6t_n - 3).
 \end{aligned}$$

Since $t_n = t_0 + nh$ and $t_0 = 0$, we can also write

$$y_{n+1} = y_n + h(2y_n - 3nh) + \frac{h^2}{2}(4y_n - 6nh - 3),$$

with $y_0 = 1$. Setting $h = 0.1$, we obtain :

t_n	0.1	0.2	0.3	0.4
y_n	1.20500	1.42210	1.65396	1.90383

The exact solution of the IVP is $y(t) = (3 + t^2)/(6 - t)$.

13. Both *Adams* methods entail the approximation of $f(t, y)$, on the interval $[t_n, t_{n+1}]$, by a polynomial. Approximating $\phi'(t) = P_1(t) \equiv A$, which is a *constant* polynomial, we have

$$\begin{aligned} \phi(t_{n+1}) - \phi(t_n) &= \int_{t_n}^{t_{n+1}} A dt \\ &= A(t_{n+1} - t_n) = Ah. \end{aligned}$$

Setting $A = \lambda f_n + (1 - \lambda)f_{n-1}$, where $0 \leq \lambda \leq 1$, we obtain the approximation

$$y_{n+1} = y_n + h[\lambda f_n + (1 - \lambda)f_{n-1}].$$

An appropriate choice of λ yields the familiar Euler formula. Similarly, setting

$$A = \lambda f_n + (1 - \lambda)f_{n+1},$$

where $0 \leq \lambda \leq 1$, we obtain the approximation

$$y_{n+1} = y_n + h[\lambda f_n + (1 - \lambda)f_{n+1}].$$

14. For a *third order* Adams-Bashforth formula, we approximate $f(t, y)$, on the interval $[t_n, t_{n+1}]$, by a *quadratic* polynomial using the points (t_{n-2}, y_{n-2}) , (t_{n-1}, y_{n-1}) and (t_n, y_n) . Let $P_3(t) = At^2 + Bt + C$. We obtain the system of equations

$$\begin{aligned} At_{n-2}^2 + Bt_{n-2} + C &= f_{n-2} \\ At_{n-1}^2 + Bt_{n-1} + C &= f_{n-1} \\ At_n^2 + Bt_n + C &= f_n. \end{aligned}$$

For computational purposes, assume that $t_0 = 0$, and $t_n = nh$. It follows that

$$\begin{aligned} A &= \frac{f_n - 2f_{n-1} + f_{n-2}}{2h^2} \\ B &= \frac{(3 - 2n)f_n + (4n - 4)f_{n-1} + (1 - 2n)f_{n-2}}{2h} \\ C &= \frac{n^2 - 3n + 2}{2}f_n + (2n - n^2)f_{n-1} + \frac{n^2 - n}{2}f_{n-2}. \end{aligned}$$

We then have

$$\begin{aligned} y_{n+1} - y_n &= \int_{t_n}^{t_{n+1}} [At^2 + Bt + C] dt \\ &= Ah^3 \left(n^2 + n + \frac{1}{3} \right) + Bh^2 \left(n + \frac{1}{2} \right) + Ch, \end{aligned}$$

which yields

$$y_{n+1} - y_n = \frac{h}{12}(23f_n - 16f_{n-1} + 5f_{n-2}).$$

15. For a *third order* Adams-Moulton formula, we approximate $f(t, y)$, on the interval $[t_n, t_{n+1}]$, by a *quadratic* polynomial using the points (t_{n-1}, y_{n-1}) , (t_n, y_n) and (t_{n+1}, y_{n+1}) . Let $P_3(t) = \alpha t^2 + \beta t + \gamma$. This time we obtain the system of algebraic equations

$$\begin{aligned} \alpha t_{n-1}^2 + \beta t_{n-1} + \gamma &= f_{n-1} \\ \alpha t_n^2 + \beta t_n + \gamma &= f_n \\ \alpha t_{n+1}^2 + \beta t_{n+1} + \gamma &= f_{n+1}. \end{aligned}$$

For computational purposes, again assume that $t_0 = 0$, and $t_n = nh$. It follows that

$$\alpha = \frac{f_{n-1} - 2f_n + f_{n+1}}{2h^2}$$

$$\beta = \frac{-(2n+1)f_{n-1} + 4nf_n + (1-2n)f_{n+1}}{2h}$$

$$\gamma = \frac{n^2+n}{2}f_{n-1} + (1-n^2)f_n + \frac{n^2-n}{2}f_{n+1}.$$

We then have

$$\begin{aligned} y_{n+1} - y_n &= \int_{t_n}^{t_{n+1}} [\alpha t^2 + \beta t + \gamma] dt \\ &= \alpha h^3 \left(n^2 + n + \frac{1}{3} \right) + \beta h^2 \left(n + \frac{1}{2} \right) + \gamma h, \end{aligned}$$

which results in

$$y_{n+1} - y_n = \frac{h}{12} (5f_{n+1} + 8f_n - f_{n-1}).$$

1(a). The *general* solution of the ODE is $y(t) = c e^t + 2 - t$. Imposing the initial condition, $y(0) = 2$, the solution of the IVP is $\phi_1(t) = 2 - t$.

(b). If instead, the initial condition $y(0) = 2.001$ is given, the solution of the IVP is $\phi_2(t) = 0.001 e^t + 2 - t$. We then have $\phi_2(t) - \phi_1(t) = 0.001 e^t$.

3. The solution of the initial value problem is $\phi(t) = e^{-100t} + t$.

(a, b). Based on the exact solution, the *local truncation error* for both of the Euler methods is

$$|e_{loc}| \leq \frac{10^4}{2} e^{-100\bar{t}_n} h^2.$$

Hence $|e_n| \leq 5000 h^2$, for all $0 < \bar{t}_n < 1$. Furthermore, the local truncation error is *greatest* near $t = 0$. Therefore $|e_1| \leq 5000 h^2 < 0.0005$ for $h < 0.0003$. Now the truncation error accumulates at each time step. Therefore the *actual* time step should be much smaller than $h \approx 0.0003$. For example, with $h = 0.00025$, we obtain the data

	<i>Euler</i>	<i>B.Euler</i>	$\phi(t)$
$t = 0.05$	0.056323	0.057165	0.056738
$t = 0.1$	0.100040	0.100051	0.100045

Note that the total number of time steps needed to reach $t = 0.1$ is $N = 400$.

(c). Using the Runge-Kutta method, comparisons are made for several values of h :

$h = 0.1$:

	$\phi(t)$	y_n	$y_n - \phi(t_n)$
$t = 0.05$	0.056738	0.057416	0.000678
$t = 0.1$	0.100045	0.100055	0.000010

$h = 0.005$:

$t = 0.1$	0.100045	0.100046	0.0000004

6(a). Using the method of *undetermined coefficients*, it is easy to show that the general solution of the ODE is $y(t) = c e^{\lambda t} + t^2$. Imposing the initial condition, it follows that $c = 0$ and hence the solution of the IVP is $\phi(t) = t^2$.

(b). Using the Runge-Kutta method, with $h = 0.01$, numerical solutions are generated

(b). Using the Runge-Kutta method, with $h = 0.01$, numerical solutions are generated

for various values of λ :

$\lambda = 1$:

	$\phi(t)$	y_n	$ y_n - \phi(t_n) $
$t = 0.25$	0.0625	0.0624999..	2×10^{-11}

$t = 1.0$	1.0	- 2.04668×10^{15}	2.04668×10^{15}

The following table shows the calculated value, y_1 , at the *first* time step :

10^{-4}	9.99999×10^{-5}	9.99979×10^{-5}	9.99833×10^{-5}	9.97396×10^{-5}

(c). Referring back to the *exact* solution given in Part(a), if a *nonzero* initial condition, say $y(0) = \varepsilon$, is specified, the solution of the IVP becomes

$$\phi_\varepsilon(t) = \varepsilon e^{\lambda t} + t^2.$$

We then have $|\phi(t) - \phi_\varepsilon(t)| = |\varepsilon| e^{\lambda t}$. It is evident that for any $t > 0$,

$$\lim_{\lambda \rightarrow \infty} |\phi(t) - \phi_\varepsilon(t)| = \infty .$$

This implies that virtually any error introduced early in the calculations will be magnified as $\lambda \rightarrow \infty$. The initial value problem is inherently *unstable*.

1. In vector notation, the initial value problem can be written as

$$\frac{d}{dt} \begin{pmatrix} x \\ y \end{pmatrix} = \begin{pmatrix} x + y + t \\ 4x - 2y \end{pmatrix}, \quad \mathbf{x}(0) = \begin{pmatrix} 1 \\ 0 \end{pmatrix}.$$

That is,

$$\begin{aligned} x_{n+1} &= x_n + h(x_n + y_n + t_n) \\ y_{n+1} &= y_n + h(4x_n - 2y_n). \end{aligned}$$

7. The Runge-Kutta method uses the following intermediate calculations:

$$\begin{aligned} \mathbf{k}_{n1} &= [x_n - 4y_n, -x_n + y_n]^T \\ \mathbf{k}_{n2} &= \left[x_n + \frac{h}{2}k_{n1}^1 - 4\left(y_n + \frac{h}{2}k_{n1}^2\right), -\left(x_n + \frac{h}{2}k_{n1}^1\right) + y_n + \frac{h}{2}k_{n1}^2 \right]^T \\ \mathbf{k}_{n3} &= \left[x_n + \frac{h}{2}k_{n2}^1 - 4\left(y_n + \frac{h}{2}k_{n2}^2\right), -\left(x_n + \frac{h}{2}k_{n2}^1\right) + y_n + \frac{h}{2}k_{n2}^2 \right]^T \\ \mathbf{k}_{n4} &= [x_n + hk_{n3}^1 - 4(y_n + hk_{n3}^2), -(x_n + hk_{n3}^1) + y_n + hk_{n3}^2]^T. \end{aligned}$$

Using $h = 0.04$, we obtain the following values:

	$n = 5$	$n = 10$	$n = 15$	$n = 20$	$n = 25$
t_n	0.2	0.4	0.6	0.8	1.0
x_n	1.3204	1.9952	3.2992	5.7362	10.227
y_n	-0.25085	-0.66245	-1.3752	-2.6435	-4.9294

The exact solution is given by

$$\phi(t) = \frac{e^{-t} + e^{3t}}{2}, \quad \psi(t) = \frac{e^{-t} - e^{3t}}{4},$$

and the associated tabulated values:

	$n = 5$	$n = 10$	$n = 15$	$n = 20$	$n = 25$
t_n	0.2	0.4	0.6	0.8	1.0
$\phi(t_n)$	1.3204	1.9952	3.2992	5.7362	10.227
$\psi(t_n)$	-0.25085	-0.66245	-1.3752	-2.6435	-4.9294

8. Let $y = x'$. The second order ODE can be transformed into the first order system

$$\begin{aligned}x' &= y \\y' &= t - 3x - t^2y,\end{aligned}$$

with initial conditions $x(0) = 1$, $y(0) = 2$. Given

$$\begin{aligned}f(t, x, y) &= y \\g(t, x, y) &= t - 3x - t^2y,\end{aligned}$$

the Runge-Kutta method uses the following intermediate calculations:

$$\begin{aligned}\mathbf{k}_{n1} &= [y_n, t_n - 3x_n - t_n^2 y_n]^T \\ \mathbf{k}_{n2} &= \left[y_n + \frac{h}{2}k_{n1}^2, g\left(t_n + \frac{h}{2}, x_n + \frac{h}{2}k_{n1}^1, y_n + \frac{h}{2}k_{n1}^2\right) \right]^T \\ \mathbf{k}_{n3} &= \left[y_n + \frac{h}{2}k_{n2}^2, g\left(t_n + \frac{h}{2}, x_n + \frac{h}{2}k_{n2}^1, y_n + \frac{h}{2}k_{n2}^2\right) \right]^T \\ \mathbf{k}_{n4} &= [y_n + hk_{n3}^2, g(t_n + h, x_n + hk_{n3}^1, y_n + hk_{n3}^2)]^T.\end{aligned}$$

With $h = 0.1$, we obtain the following values:

	$n = 5$	$n = 10$
t_n	0.5	1.0
x_n	1.543	0.07075
y_n	1.14743	-1.3885

9. The *predictor* formulas are

$$\begin{aligned}x_{n+1} &= x_n + \frac{h}{24}(55f_n - 59f_{n-1} + 37f_{n-2} - 9f_{n-3}) \\ y_{n+1} &= y_n + \frac{h}{24}(55g_n - 59g_{n-1} + 37g_{n-2} - 9g_{n-3}).\end{aligned}$$

With $f_{n+1} = x_{n+1} - 4y_{n+1}$ and $g_{n+1} = -x_{n+1} + y_{n+1}$, the *corrector* formulas are

$$\begin{aligned}x_{n+1} &= x_n + \frac{h}{24}(9f_{n+1} + 19f_n - 5f_{n-1} + f_{n-2}) \\ y_{n+1} &= y_n + \frac{h}{24}(9g_{n+1} + 19g_n - 5g_{n-1} + g_{n-2}).\end{aligned}$$

We use the starting values from the *exact solution* :

	$n = 0$	$n = 1$	$n = 2$	$n = 3$
t_n	0	0.1	0.2	0.3
x_n	1.0	1.12883	1.32042	1.60021
y_n	0.0	- 0.11057	- 0.250847	- 0.429696

One time step using the *predictor-corrector* method results in the approximate values:

	$n = 4(pre)$	$n = 4(cor)$
t_n	0.4	0.4
x_n	1.99445	1.99521
y_n	- 0.662064	- 0.662442
